Graph States and
Cluster States

Kernel Pattern

Connecting Kernel
Patterns

Implementation

References

- Graph states are entangled states over many qubits, with a very simple description.
- A collection of vertices, some of whom are linked by an edge. This leads to their name "graph states".
- Each vertex represents a qubit, each edge represents an entangle operation.
- The graph structure gives a method of constructing the graph states.

Constructing the graph states

1WQC

Wang Kun

Introduction

Preliminaries

One-Way
Quantum
Computation

Graph States and
Cluster States

Kernel Pattern

Connecting Kernel
Patterns

Implementation

References

- With every vertex we associate a qubit, initially prepared in state $|+\rangle = [|0\rangle + |1\rangle]/\sqrt{2}$.
- The graph state is obtained by applying a CZ gate (entangle operation) to each edge on the graph.
- A CZ gate has the following truth table and is order-independent:

$$|00\rangle \mapsto |00\rangle, |01\rangle \mapsto |01\rangle, |10\rangle \mapsto |10\rangle, |11\rangle \mapsto -|11\rangle$$

$$\text{CZ}|i\rangle|j\rangle = (-1)^{ij}|i\rangle|j\rangle, i, j \in \{0, 1\}$$

- So far I have described the one-way quantum computation model.
- It guides us to implement 1WQC in the lab:
 - Step1. Build a cluster state,
 - Step2. Measure qubits one by one in specific order.

- So far I have described the one-way quantum computation model.
- It guides us to implement 1WQC in the lab:
 - Step1. Build a cluster state,
 - Step2. Measure qubits one by one in specific order.
- There are systems where the one-way model has some significant practical advantages.

■ Optical lattices

- **Pro:** cluster states can be generated efficiently, already implemented in labs.
- **Con:** it is (currently!) not possible to perform single-qubit measurements on atoms.

- **Con:** it is (currently!) not possible to perform single-qubit measurements on atoms.

■ Linear optics

- **Pro:** efficient strategies for building cluster states.
- **Con:** single-qubit measurements may fail, thus destroying precious quantum coherence.

■ Linear optics

- **Pro:** efficient strategies for building cluster states.
- **Con:** single-qubit measurements may fail, thus destroying precious quantum coherence.

■ Cavity QED

- **Pro:** atoms interact in cavities, implementing CZ gates and cluster state.
- **Con:** hard to implement single-qubit measurements.
